New React Developer Tools

September 2, 2015 by Ben Alpert

A month ago, we posted a beta of the new React developer tools. Today, we're releasing the first stable version of the new devtools. We're calling it version 0.14, but it's a full rewrite so we think of it more like a 2.0 release.

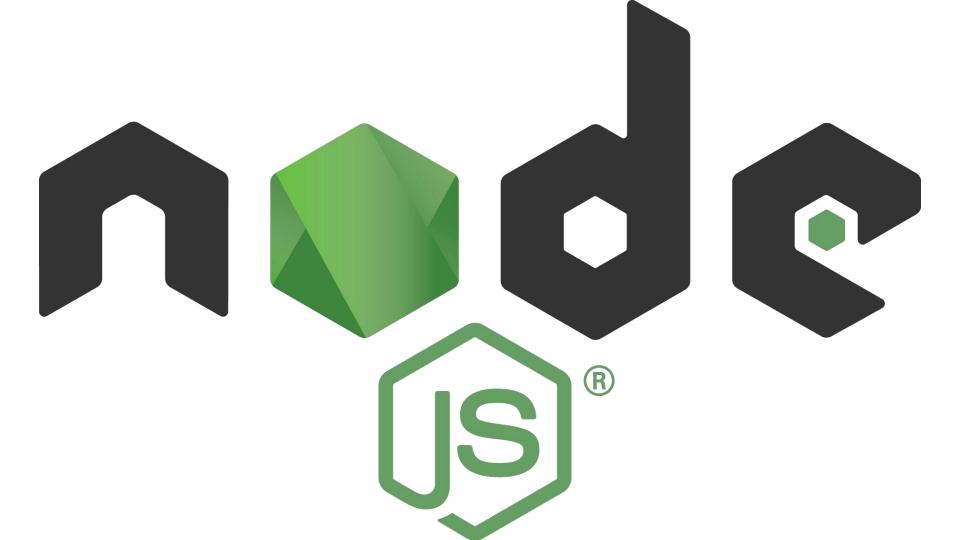

- Create Files
- Write Code
- Persist Changes to Disk
- Step Through Debug
- Audit Pages
- Emulate Devices

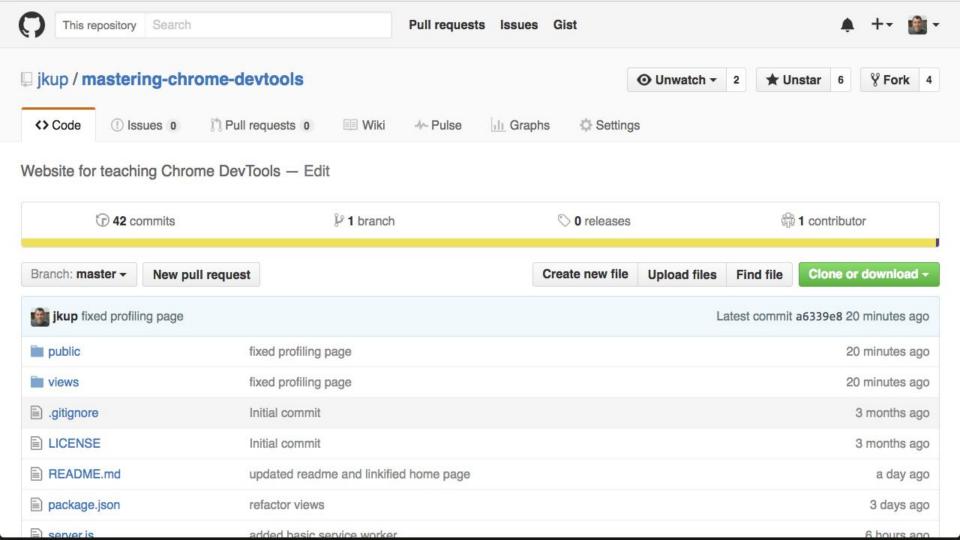

- Simulate Network Conditions
- Find and Fix Memory Leaks
- Profile Your Code
- Analyze JavaScript performance
- Spot page jank

Workspaces

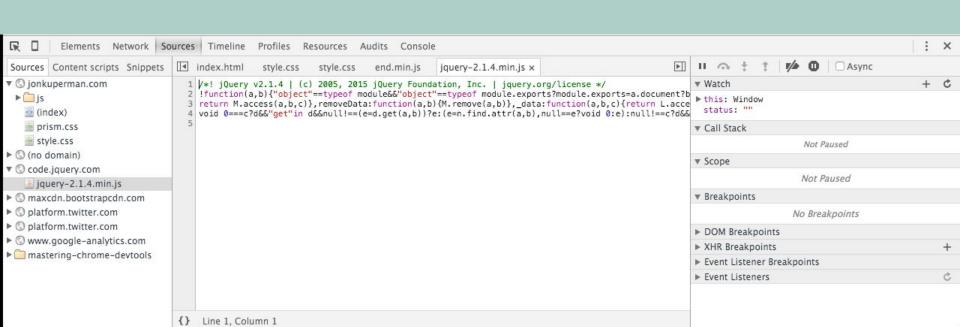

Limitations

As powerful as Workspaces are, there are some limitations you should be aware of.

- Only style changes in the Elements panel are persisted; changes to the DOM are not persisted.
- Only styles defined in an external CSS file can be saved. Changes to element.style or to inline styles are not persisted. (If you have inline styles, they can be changed on the Sources panel.)
- Style changes in the Elements panel are persisted immediately without an explicit save ctrl + s
 or cmd + s (Mac) if you have the CSS resource mapped to a local file.
- If you are mapping files from a remote server instead of a local server, when you refresh the page,
 Chrome reloads the page from the remote server. Your changes still persist to disk and are reapplied if you continue editing in Workspaces.
- You must use the full path to a mapped file in the browser. Even your index files must include .html in the URL, in order to see the staged version.

Profiling

How important is load time?

- Google.com: +500 ms (speed decrease) -> -20% traffic loss
- Yahoo.com: +400 ms (speed decrease) -> -5-9% full-page
 traffic loss (visitor left before the page finished loading)
- Amazon.com: +100 ms (speed decrease) -> -1% sales loss

About PageSpeed Insights

PageSpeed Insights analyzes the content of a web page, then generates suggestions to make that page faster. Learn more.

Common Audit Problems

- 1. Combine external CSS and JS
- 2. Enable gzip compression (Apache, Node, WordPress)
- Compress images (https://imageoptim.com/)
- 4. Leverage Browser Caching
- 5. Put CSS in document head
- 6. Unused CSS rules (Old CSS that can be pruned)

Network

Terninology

Queuing

If a request is queued it indicated that:

- The request was postponed by the rendering engine because it's considered lower priority than critical resources (such as scripts/styles). This often happens with images.
- The request was put on hold to wait for an unavailable TCP socket that's about to free up.
- The request was put on hold because the browser only allows six
 TCP connections per origin on HTTP 1.
- Time spent making disk cache entries (typically very quick.)

Stalled/Blocking

Time the request spent waiting before it could be sent. It can be waiting for any of the reasons described for Queueing. Additionally, this time is inclusive of any time spent in proxy negotiation.

Proxy Negotiation

Time spent negotiating with a proxy server connection.

DNS Lookup

Time spent performing the DNS lookup. Every new domain on a page requires a full roundtrip to do the DNS lookup.

Initial Connection / Connecting

Time it took to establish a connection, including TCP handshakes/retries and negotiating a SSL.

SSL

Time spent completing a SSL handshake.

Request Sent / Sending

Time spent issuing the network request. Typically a fraction of a millisecond.

Waiting (TTFB)

Time spent waiting for the initial response, also known as the Time To First Byte. This time captures the latency of a round trip to the server in addition to the time spent waiting for the server to deliver the response.

Content Download / Downloading

Time spent receiving the response data.

Common Probems

Queued or Stalled

This indicates that too many resources are being retrieved from a single client. On HTTP 1.0/1.1 connections, Chrome enforces a maximum of six TCP connections per host.

Slow Time to First Byte

- 1. Bad network conditions between client and server, or
- 2. A slowly responding server application

Demo Time!

Page Jank

plain halting that users see when a site or app isn't keeping up with the refresh rate.

Jank is any stuttering, juddering or just

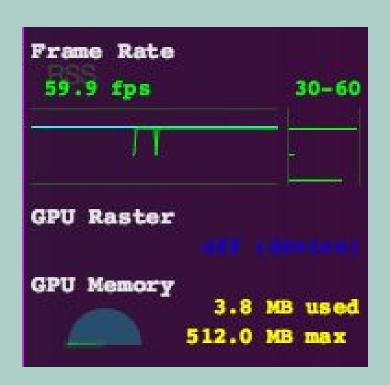

Most devices today refresh their screens 60 times a second. The browser needs to match the device's refresh rate and put up 1 new picture, or frame, for each of those screen refreshes.

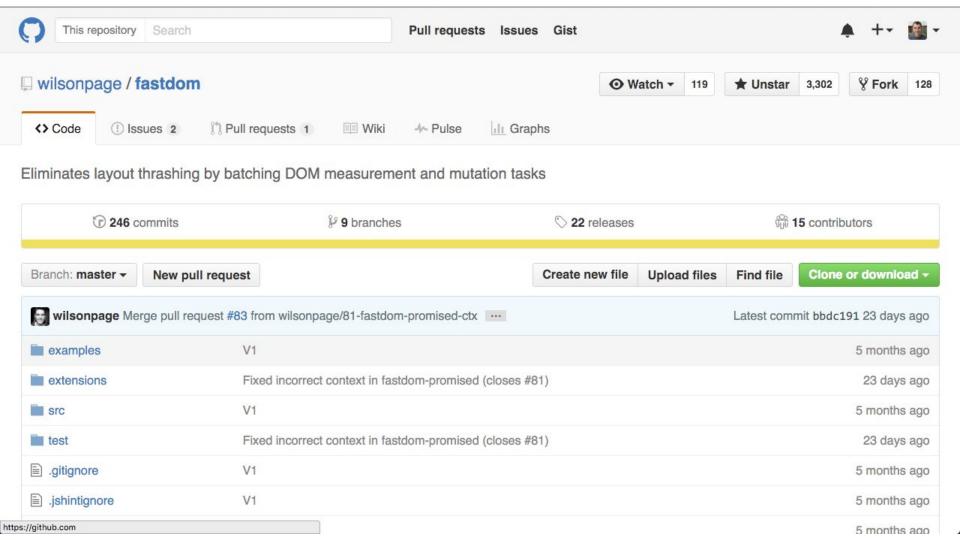

Each of those frames has a budget of just over 16ms (1 second / 60 = 16.66ms). In reality, however, the browser has housekeeping work to do, so all of your work needs to be completed inside 10ms.

Timeline (again)

```
// Read
var h1 = element1.clientHeight;
// Write (invalidates layout)
element1.style.height = (h1 * 2) + 'px';
// Read (triggers layout)
var h2 = element2.clientHeight;
// Write (invalidates layout)
element2.style.height = (h2 * 2) + 'px';
// Read (triggers layout)
var h3 = element3.clientHeight;
// Write (invalidates layout)
element3.style.height = (h3 * 2) + 'px';
```

Memory Leaks

Common JavaScript Memory Leaks

The Accidental Global

```
function foo() {
   bar = "this is probably not what you meant";
}
```

The Forgotten Interval

```
var bigData = getData();
setInterval(function() {
    document.body.innerHTML = JSON.stringify(bigData));
}, 1000);
```

The DOM and not the DOM

```
var button = document.getElementById('button');

// Then later..

function removeButton() {
    document.body.removeChild(document.getElementById('button'));
}
```
